

LegalVault Project Proposal

1. Problem Statement

Legal teams and individuals often manage contracts, case documents, notices, and supporting files across disconnected folders. Finding the correct document and understanding what it contains can be slow and error-prone.

2. Proposed Solution

LegalVault is a document management application for organizing legal documents in one searchable workspace. Users can upload documents, assign metadata, search documents, and review document details.

3. Target Users

Legal professionals

Students or researchers working with legal documents

Individuals maintaining personal legal records

4. Core Features

Document upload

Document categorization

Metadata management

Search

Document preview

Basic access control

5. Scope

The initial system focuses on document organization, retrieval, and metadata. Advanced legal advice, automated legal conclusions, and autonomous legal decision-making are outside the initial scope.

6. Expected Outcome

Users should be able to store legal documents in an organized workspace and retrieve relevant documents without manually searching through unrelated files.
